APSOplast®

Engineering Plastics

APSOplast® – Innovative Solutions Involving Plastics

Plastics are used in a vast array of areas. Innovations and new product developments are constantly bringing new materials with excellent properties onto the market. Angst + Pfister continually keeps abreast of the dynamic developments in plastics technology and offers a comprehensive range of products and services for practically all applications.

Engineering services

Our specialists have extensive experience and expertise in materials and manufacturing technology. Whether proof-of-concept prototype, finished product or targeted further development – we are there to support you in any phase. We base our consultations on well-grounded expertise and work together with you to devise the best solution for your application.

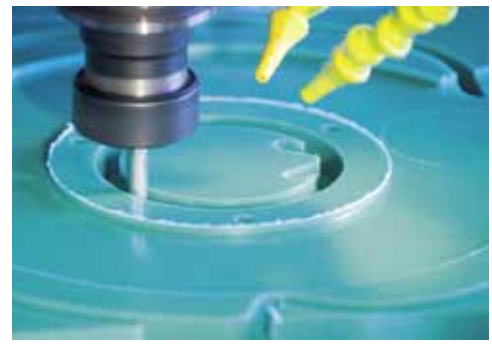
Plastics assortment

Our European logistics center stocks an extensive assortment of semifinished products in more than 100 different types of plastic – ranging from simple standard plastics to ultra-high-performance plastics. Specially modified plastics are also available to meet application-specific requirements such as ATEX-compliant explosion protection. For uses in the food industry and medical technology, we provide the requisite product conformities and certifications such as ISO 10993, USP and FDA.

Cutting-to-size service and preliminary machining

High-performance computerized cutting equipment guarantees precision cutting to size and angle in accordance with customer specifications. State-of-the-art sawing, planing and molding machines enable customized preliminary machining of the blanks, which can then be efficiently further processed or finished by the customer. This also eliminates costly warehousing for customers and spares them the trouble and expense of having to dispose of offcuts or swarf. With our cut-to-size configurator, you can also easily calculate and order custom-cut plastic plates from our APSOparts® online shop at shop.angst-pfister.com.

Customized finished plastic parts



Ready-to-use finished parts are manufactured on a customer-specific basis, i.e. from drawings, sketches or samples on powerful CNC or conventional machine tools using methods such as turning, milling or drilling – whether as prototypes, in small batches, or all the way up to mass production series. Angst + Pfister also supplies outline-cut finished parts processed by means of stamping, water jet cutting and laser cutting. Hot forming of transparent plastics, casting of polyurethanes, and extrusion and injection molding of thermoplastics round out our offering.

Visit our APSOparts® online shop at shop.angst-pfister.com to view our current range of plastics on offer.

Standard plastics

Our range of standard plastics includes polystyrene, PVC and the polyolefins PE and PP. These inexpensive plastics can be used in many areas. We also carry a selection of transparent plastics such as PMMA, PET-A and PC with high temperature and impact resistance.

Duroplastics

Duroplastics are offered in the form of laminated materials and pultrusion products (FRP). Duroplastics stand out for their hardness, rigidity and excellent dimensional stability. They retain their dimensional stability to the greatest extent even at high temperatures (highly resistant to heat).

Engineering plastics

The plastics most frequently used in mechanical and apparatus engineering are the semicrystalline plastics PA, POM, PET and their modifications. Their good mechanical stability and excellent slide and wear properties make them suitable for a wide variety of uses. A vast number of modified variants enable optimum solutions to be found for the most widely differing requirements.

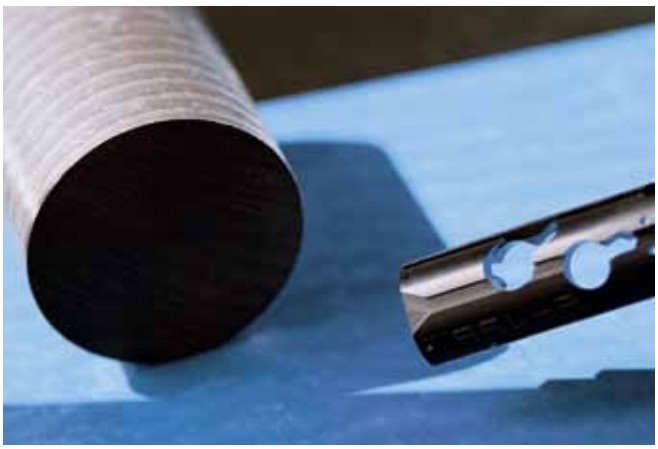
High-performance plastics

All high-performance plastics exhibit high to very high temperature resistance as well as high strength and dimensional stability. Differentiation is made between plastics with amorphous structure (partially transparent) for rather static applications and plastics with semi-crystalline structure, high impact resistance and good to excellent sliding and wear properties. Polyimides stand out for their extraordinary application possibilities at extremely high and low temperatures.



Selection criteria

Fluoroplastics

Among the main features of PTFE, the most important fluoroplastic, are high chemical and thermal resistance, exceptional dielectric properties and excellent sliding behavior. PTFE is the base plastic for a series of modifications that have been expressly developed with specific properties in mind. These are high-performance special compounds made of PTFE that contain selected fillers and reinforcing materials and enable a material selection finely matched to the application.

Elastomers

Elastomers are materials with high elasticity and great extensibility and recovery capability. These properties make elastomers an irreplaceable material in sealing, fluid handling, antivibration and drive technology. Elastomers are based on natural and synthetic rubbers.

Polyurethanes (PUR)

Polyurethanes – unlike elastomers based on rubber – are manufactured using molding methods and do not contain carbon black. In comparison with other elastomers, they also have high mechanical property values and feature exceptional abrasion and tear resistance.

Selection criteria

Angst + Pfister – Your Supply and Solutions Partner

The Angst + Pfister Group is a leading international technical distributor and service provider for high-end industrial components. As a supply and solutions partner for engineering plastics, sealing, fluid-handling, drive, and antivibration technology as well as sensors, Angst + Pfister combines efficient logistics concepts with comprehensive product application engineering services. Besides providing customer-specific parts, the group offers a product range consisting of approximately 150,000 standard items.
